

CHAPTER – II

IDEATION PHASE

2.1 – Problem Statement

The cosmetics industry is growing very fast, and customer preferences change frequently. New products are launched regularly, and customers are influenced by trends, advertisements, social media, and seasonal changes. Because of this, cosmetic companies generate large amounts of data every day, including sales data, product details, customer information, and market trends. However, this data is often complex and difficult to understand when it is stored in raw tables or simple reports.

Many companies face difficulty in analysing this large amount of data in a meaningful way. They may not clearly understand which products are performing well, which products are not selling, or which customer groups are buying specific items. It also becomes hard to identify which regions have high demand and which areas need improvement. Without clear analysis, businesses may miss important opportunities and fail to respond quickly to market changes.

Another major issue is the lack of proper visualization tools for decision-making. When data is not presented in a visual and interactive format, it becomes difficult for managers and decision-makers to study patterns and trends. This often leads to decisions being made based on assumptions rather than actual data. As a result, companies may face problems such as incorrect inventory planning, weak marketing strategies, and low customer satisfaction.

Cosmetic companies also struggle to understand customer behaviour in detail. Customers differ based on age, gender, location, income, and personal preferences. Without proper analysis, it is difficult to know what different customer groups prefer and how their needs are changing over time.

To solve these problems, there is a need for a simple, effective, and interactive system that can analyse cosmetics data and present it in an easy-to-understand way. Businesses need a tool that can convert raw data into meaningful insights and visual reports so that decision-makers can quickly understand the situation and take action.

The Cosmetic Insights – Navigating Cosmetics Trends and Consumer Insights with Tableau project addresses these challenges by using Tableau to create interactive dashboards and visualizations. These dashboards bring all important data into one place and present it in the form of charts, graphs, and maps. This helps users easily understand sales performance, customer behaviour, product popularity, and market trends.

It helps cosmetic companies make better decisions, improve performance, increase customer satisfaction, and stay competitive in the fast-changing cosmetics market.
